angulum. Nam nisi B. in D. repercuteretur; faceret CDE. angulum æqualem ipsi BDF. quia recta esset linea BDE. At non impediens CDE. angulum, repercutit tamen B. in partes BA. Ergo quantum B. non repercutsum, fuisse concessurum in partes à B. versus AE. tantum eodem concedit, et si repercutiatur; non autem in E. quia repercutitur; ergo in A. vt CDE. & CDA. sint æquales, sed & BDF.CDE. forent æquales sine reperclusu; ergo BDF. incidentia, & ADC. reflexionis anguli sunt æquales.

PROPOSITIO XX.

Lux in superficiem medii densioris obliquè illapsa, refringitur ad perpendicularē superficieī. Nam per 14. & 16. lux hīc motui suo contraria, medio similia patitur. At motus lucem spargit, medium ponitur esse densius. Ergo mediū impedit, quō minus lux spargatur. Est verò argumentū sparsionis, obliqua incidentia; propterea q̄ in quam superficiem lux obliquè incidit, in eandem continuatam & recte incidit, ergo inter rectū & obliquum radios, angulus interiicitur; angulo vero radii spargitur. Sit radius obliquus AB.

incidens in superficiem in punto B. agatur tangens illam superficiē, quæ sit B.C. & ab A. descendat perpendicularis AC. Hic ergo lux ex A. angulo BAC. spargitur ad unum latus, & quantum lucis intra BAC. angulū fuit in partibus ipsi A. prioribus; tantundem est & in BC. linea. Continuata AB. in D. AC. in E. vt DE. sit parallelos ad BC. si in BC. non occurrat superficies densior, spargetur lux amplius, eritque iam rursus tantundem lucis in DE. quantum fuit in BC. At si superficies BC. sit densioris medii, sistet hanc dispersionem per 14. idque secundum magis & minus. Lux vero BC. si sine dispersione porrò moueat, oportebit illam in DE. superficie tantundem occupare spatii, ac in BC; quare ex DE. refecari aliquam, æqualem BC. illa sit FE. Nam in ACE. est terminus omnis dispersionis lucis, quia AC. radius in CB. rectus; quare E. communis terminus
